## Space Shuttle Experiments

Hiện tại, bài tập này đã có trên online judge chính thức của VNOI, bạn có thể truy cập ở đây: https://oj.vnoi.info/problem/spse

Professor Spook is consulting for NASA, which is planning a series of space shuttle flights and must decide which commercial experiments to perform and which instruments to have on board each flight. For each flight NASA considers a set $\mathbf{E}=\left\{\mathbf{E}_{\mathbf{1}}, \mathbf{E}_{\mathbf{2}}, \ldots, \mathbf{E}_{\mathbf{m}}\right\}$ of instruments experiments and the commercial sponsor of $\mathbf{E}_{\mathbf{j}}$ has agreed to pay NASA $\mathbf{p}_{\mathbf{j}}$ dollars for the results of the experiments.

The experiments use a set $\mathbf{I}=\left\{\mathbf{I}_{\mathbf{1}}, \mathbf{I}_{\mathbf{2}}, \ldots, \mathbf{I}_{\mathbf{n}}\right\}$ of instruments; each experiment $\mathbf{E}_{\mathbf{j}}$ requires some of the instruments from the set. The cost of carrying instruments $\mathbf{I}_{\mathbf{k}}$ is $\mathbf{c}_{\mathbf{k}}$ dollars. And an instrument can be used for multiple experiments.

The professor's job is to determine which experiments to perform and which instruments to carry for a given flight in order to maximize the net revenue, which is the total income from the experiments performed minus the total cost of the instruments carried. Since he is not a programmer, he asked your help.

## Input

Input starts with an integer $\mathbf{T}(\mathbf{\leq 1 0 0})$, denoting the number of test cases.
Each case starts with a line containing two integers $\mathbf{m}(1 \leq m \leq 1000)$ and $\mathbf{n}(\mathbf{1} \leq \mathbf{n} \leq$ 1000), where $\mathbf{m}$ denotes the number of experiments and $\mathbf{n}$ denotes the number of instruments. The next line contains $m$ space separated integers, where the $j^{\text {th }}$ integer denotes the commercial sponsor of $\mathbf{E}_{\mathbf{j}}$ paying NASA $\left.\mathbf{p}_{\mathbf{j}} \mathbf{( 1 \leq} \mathbf{p}_{\mathbf{j}} \leq \mathbf{1 0 0 0 0}\right)$ dollars for the result of the experiment. The next line contains $\mathbf{n}$ space separated integers, where the $\mathbf{k}^{\text {th }}$ integer denotes the cost of carrying the $\mathbf{k}^{\text {th }}$ instrument, $\mathbf{c}_{\mathbf{k}}\left(\mathbf{1 \leq} \mathbf{c}_{\mathbf{k}} \leq \mathbf{1 0 0 0 0}\right)$. Each of the next $\mathbf{m}$ lines contains an integer $\mathrm{q}_{\mathrm{i}}\left(1 \leq \mathrm{q}_{\mathrm{i}} \leq\right.$ $\mathbf{n}$ ) followed by $\mathbf{q}_{\mathbf{i}}$ distinct integers each between $\mathbf{1}$ and $\mathbf{n}$, separated by spaces. These $\mathbf{q}_{\mathbf{i}}$ integers denote the required instruments for the $\mathbf{i}^{\text {th }}$ experiment.

## Output

For each case, print the case number and the maximum revenue NASA can make using the experiments.

| Sample Input | Output for Sample Input |
| :--- | :--- |
| 2 | Case $1: 0$ |
| 11 | case $2: 13$ |
| 10 |  |

| 20 |  |
| :--- | :--- |
| 11 |  |
| 3 | 5 |
| 20 | 3040 |
| 1230450 |  |
| 3 | 23 |
| 3234 |  |
| 15 |  |
